

# Privacy-Preserving & Incrementally-Deployable Support for Certificate Transparency in Tor

July 15, 2021

**Rasmus Dahlberg**, Tobias Pulls, Tom Ritter, and Paul Syverson

## A flash-back into the past

- June, 2011
- Netherlands, Beverwijk
- DigiNotar

<https://creativecommons.org/licenses/by-sa/3.0/>

## What happened?

- DigiNotar issued web certificates
- Did not live up to expectations
- Then tried to cover it up<sup>1</sup>

<https://www.bbc.com/news/technology-14989334>

A stealthy attacker might have gotten away with it!

---

<sup>1</sup> FoxIT. Black Tulip: Report of the investigation into the DigiNotar Certificate Authority breach. Page 3.

## Larger problem and solution?

- Digitar was not a one-time incident<sup>2</sup>
- Many other parties can get it wrong
- Add visibility into issued certificates<sup>3</sup>

<sup>2</sup><https://sslmate.com/certspotter/failures>

<sup>3</sup><https://certificate.transparency.dev/>

## Certificate Transparency (CT) compliance<sup>4</sup>

“Two logs promised that they will make the certificate public”

---

<sup>4</sup> [https://github.com/chromium/ct-policy/blob/master/ct\\_policy.md](https://github.com/chromium/ct-policy/blob/master/ct_policy.md) & <https://support.apple.com/en-us/HT205280>

## Problem statement

- Tor Browser does not enforce CT
- Guard against prominent threats
  - ▶ DigiNotar style attacks
  - ▶ Interception to deanonymize
- Aim higher than CT compliance

Attacker with browser exploit, CA, CT logs, and usual Tor capabilities

## Gradual roll-out plan

- |   |  |
|---|--|
| 1. Catch up with CT compliant browsers      | <i>pairs of logs</i> are trusted blindly |
| 2. Steps towards decentralized verification | <i>some log</i> is trusted blindly       |
| 3. Fully decentralized verification         | <i>no log</i> is trusted blindly         |

# Overview of the full design

Security? Difficult to interfere without detection in any phase

## Submission phase

### Straw man proposals

- Fetch an inclusion proof
- Rely on a centralized party

### What we do instead

- Use Tor relays, “CTRs”
- Probabilistic submit

It must be difficult to infer which CTR received an SFO

## Buffering phase

- Buffer until logging is required
- Add a random delay to leak less
- Cache audited SFOs to leak less

The attacker's best bet to interfere is trivially detectable

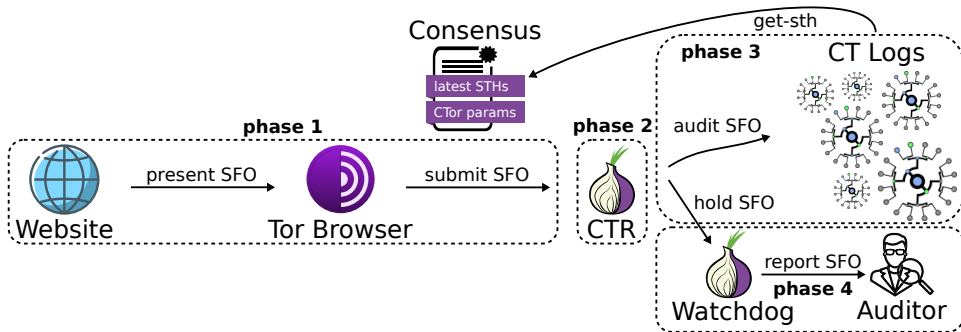

## Audit and report phases

- Fetch inclusion proof against a specific STH
- Rely on Tor's consensus to agree on STHs
- Watchdog CTRs do the reporting if needed
  - ▶ Protects against CTR identification

Why not just send to a trusted auditor immediately?

## Putting it all together

This is quite a leap from CT compliance

# Incremental design

Use the log ecosystem against the attacker

## Take away

- Tor Browser would benefit from CT
- CT would benefit from more auditing
- Delegated auditing is key in our setting
